

## Lower North Scappoose Creek Project

November 2018 – April 2020

In order to address key limiting factors for salmonids, this restoration will improve and enhance fish and wildlife habitat along a quarter of mile section of North Scappoose Creek.

The project goals are to:

- Enhance fish habitat and instream channel complexity
- Increase native vegetation and diversity along riparian corridor to reduce streambank erosion, increase stream shading, and support future large wood availability

Improvements to the physical habitat quality and complexity include:

- Installing large wood within the stream bank
- Laying back a short section of the streambank
- Adding a significant amount of native riparian vegetation

### Location:

Project activities will occur primarily on the left (north) bank of North Scappoose Creek between Hwy 30 and Scappoose-Vernonia Road.

### Timeline:

Project construction: June – September 2019

Riparian planting: October 2019 – April 2020
